Project Overview

Expense Tracker using Javascript

An Expense Tracker is a web application used to manage personal finances by recording income and expenses.

Objectives

Records income and expenses

- Displays current balance
- Calculates total income and total expenses
- Allows users to delete transactions
- Provides a responsive and interactive interface

Problems Solved

(Why people need expense tracking?)

- Helps users track where their money is being spent
- Reduces unnecessary and impulsive spending
- Eliminates confusion caused by manual expense calculations
- Prevents overspending by monitoring budgets
- Saves time compared to maintaining handwritten records
- Helps users identify spending patterns and habits
- Makes monthly financial planning easier
- Organizes expenses into categories like food, travel, shopping
- Assists in setting and achieving savings goals
- Generates reports and charts for better financial analysis
- Helps students and working professionals manage personal finances .

ABOUT POCKETLOG

What is PocketLog?

PocketLog is an intelligent expense management application that uses AI-powered features to simplify personal finance tracking.

It helps users:

- Record and organize expenses
- Visualize spending trends
- Make smarter financial decisions
- Improve budgeting habits
- Track expenses in real time

PocketLog transforms traditional expense tracking into a smart and interactive financial experience.

KEY FEATURES OF POCKETLOG AND THE CONCEPT AND TECHNOLOGY USED BEHIND IT

SIGNUP PAGE

“The sign-up page of PocketLog was developed using HTML, CSS, and JavaScript. HTML was used to structure the form elements, CSS was used to create a responsive modern dark-themed interface, and JavaScript was implemented for form validation and interactive functionality.”

A screenshot of the PocketLog sign-up page. The page has a dark theme with a black background. At the top, there is a white icon of a wallet with a card. Below the icon, the text "PocketLog" is displayed in a bold, white font, followed by the tagline "Track your student spending" in a smaller, lighter font. There are two buttons: "Log In" and "Sign Up", both in white text on dark backgrounds. Below these buttons, there are three form fields: "Name" with the placeholder text "What should we call you?", "Username" with the placeholder text "Pick a username", and "Password" with the placeholder text "At least 4 characters". At the bottom, there is a large, prominent blue button with the text "Create Account" in white.

LOGIN PAGE

“The login page of PocketLog was designed using HTML, CSS, and JavaScript to deliver a clean and interactive user experience. HTML handled the page structure, CSS was used for the modern dark-themed design and responsiveness, while JavaScript enabled validation and smooth login functionality.”

DASHBOARD

The PocketLog dashboard was developed using **HTML**, **CSS**, and **JavaScript** to create a modern and interactive expense management system. HTML was used for structuring the dashboard components, CSS for designing the responsive dark-themed user interface, and JavaScript for implementing dynamic functionalities such as real-time expense updates, transaction handling, chart visualization, and budget calculations. JavaScript concepts including DOM Manipulation, Event Handling, Functions, Arrays, Objects, Conditional Statements, and Local Storage were used to manage user data and provide an interactive user experience.

EXPENSES

“The Expenses module in PocketLog is designed to help users efficiently organize and monitor their daily spending activities. The interface is built using HTML for structured transaction management, CSS for creating a clean and visually appealing layout, and JavaScript for handling interactive operations such as expense addition, live searching, filtering, editing, and deletion. Advanced JavaScript concepts including DOM operations, array methods, event listeners, objects, and browser local storage are implemented to ensure smooth real-time expense management and seamless user experience.

BUDGETS

HTML: Used to create the structure of the dashboard, sidebar, cards, buttons, and budget sections.

CSS: Used for dark theme styling, grid layout, flexbox alignment, responsive design, shadows, hover effects, and modern UI appearance.

JavaScript: Used for dynamic budget calculations, updating expense data, progress bars, button interactions, DOM manipulation, and local storage functionality.

Frameworks/Libraries: React.js, Tailwind CSS, and icon/UI libraries may have been used for faster development and modern design.

COMPARE

HTML: Used to create the structure of sidebar, dropdowns, summary cards, and chart section.

CSS: Used for dark theme styling, responsive layout, flexbox/grid alignment, animations, and modern dashboard design.

JavaScript: Used for comparing monthly expenses, updating charts dynamically, handling dropdown selections, and calculating totals.

Chart Library: Libraries like Chart.js/Recharts used for side-by-side bar graph visualization.

Frameworks: React.js and Tailwind CSS may be used for faster development and modern UI components.

AI ASSISTANT

Frontend (UI) : HTML & CSS for chatbot layout, message box, buttons, and dark theme design. JavaScript/React.js for real-time chat interaction and updating messages dynamically.

AI Processing : Uses an AI API such as OpenAI API or Google Gemini API. Handles user questions like expense analysis, budget checks, and money tips.

Backend : Node.js / Express.js likely used to connect frontend with AI services. Processes requests and sends responses from the AI model.

Database/Storage : Local Storage, Firebase, or MongoDB may store: chat history, expenses, user budget data

Natural Language Processing (NLP) : Helps the bot understand user queries like: “How much did I spend?”, “Show top expenses”, “Give money tips”

Additional Libraries : Socket.io or async APIs for real-time messaging

Chart libraries for expense insights Tailwind CSS for chatbot styling and responsiveness

ADD EXPENSE BOX

HTML : HTML is used to create the popup dialog box structure. It contains: Form container . Input fields, Dropdown menu, Date picker, Save and Cancel buttons Elements like <form>, <input>, <select>, and <button> are used to collect expense details from the user.

CSS : CSS is used to style and position the dialog box in the center of the screen. Main concepts used: Modal/Popup Design, Fixed positioning, Flexbox centering, Dark transparent overlay. Rounded corners and shadows, Hover effects on buttons, Responsive sizing
Example concepts : position: fixed; display: flex; justify-content: center; align-items: center;

JavaScript : JavaScript controls the popup functionality. Used for: Opening the dialog box when “Add Expense” is clicked, Closing it using Cancel button, Saving form data, Validating input fields, Dynamically updating expenses list. Important concepts: Event listeners, DOM manipulation, Form handling, Dynamic UI updates

THANK YOU
